

Mediafacade

en_v2.0

contains: true to scale sizes of the facade and step-by-step manual for the After Effects file included in the .rar package to generate a movie for the mediafacade

POV Ludwig

h= 1,80 (eye height)
heightdifference = 3,40

lower ledge window
h = 5,40

higher ledge window
h= 8,40

theoretical angle from
eye height POV to middle
height, edge gallery curtain
 $\alpha = 11,9^\circ$

step #8

as soon as the file is rendered, we have to render it thanks to cs6 again with the Quicktimeplayer

for that, we use our QT Pro, which we load out of the internet <http://www.apple.com/de/quicktime/download/> and register with our name and key:

name: Hr Burkhard Detzler

key: 8BX2-UQ9K-7YSR-WAN5-63FU

now we open the former rendered file with the qt-player and „export“ it with ctrl+E or over the menu file > export with the following settings:

container:	.mov
codec:	h264
max. datarate:	25.000kbit/s
keyframes alle:	15frames
size:	2400x1200px (original size)
mode:	mehrere Durchgänge

like this, we can export the file to, for instance, \\Hera\transfer into a folder one day before its needed and send a notification to the person who is supposed to work with the files ...
